

# native forestry in WA

---

Native forests are regenerated post-harvest, in line with strict ecologically sustainable forest management practices.

Native forestry contributes \$220 million to the WA economy and directly employs more than 500 people.

Old growth forests, high conservation value forest, habitat trees and riparian zones are protected.

100% utilisation with all timber going to the highest value use, from furniture through to silicon produced from charcoal.

Plantation forestry and native forestry are not interchangeable.

Land availability, market access & fibre properties are all factors.

The result would be an increased reliance on imported timber.

Actively managed, multiple-use forests fight climate change, provide renewable resources and recreational opportunities.
